 $\S1$ IAD (v 3-11-6) MAIN PROGRAM 1

1. Main Program.

Here is a relatively robust command line utility that shows how the iad and ad subroutines might be called. It suffers because it is written in CWEB and I used the macro expansion feature instead of creating separate functions. Oh well.

I create an empty file iad_main.h to simplify the Makefile $\langle iad_main.h \ 1 \rangle \equiv$

```
2. All the actual output for this web file goes into iad_main.c
```

```
\langle iad_main.c \rangle \equiv
   \langle Include files for main 3\rangle\langle print version function 20\rangle\langle print usage function 21\rangle\langle stringdup together
                    function 27\langle seconds elapsed function 28\langle print error legend function 26\langle print dot
                    function 30 \ \calculate coefficients function 22 \ \chi parse string into array function 29 \ \chi print
                    results header function 24\\Print results function 25\\int main(int argc, char **argv)\{
                    \langle \text{ Declare variables for } main \ 4 \rangle \langle \text{ Handle options } 5 \rangle Initialize\_Measure(\&m);
              \langle \text{Command-line changes to } m \ 18 \rangle Initialize\_Result(m, \&r); \langle \text{Command-line changes to } r \ 13 \rangle
              if (cl\_forward\_calc \neq \texttt{UNINITIALIZED}) {
                 ⟨ Calculate and Print the Forward Calculation 6⟩ return 0;

```

6. We are doing a forward calculation. We still need to set the albedo and optical depth appropriately. Obviously when the -a switch is used then the albedo should be fixed as a constant equal to $cl_default_a$. The other cases are less clear. If scattering and absorption are both specified, then calculate the albedo using these values. If the scattering is not specified, then we assume that the sample is an unscattering sample and therefore the albedo is zero. On the other hand, if the scattering is specified and the absorption is not, then the albedo is set to one.

```
 \begin{split} &\langle \text{Calculate and Print the Forward Calculation } 6 \rangle \equiv \\ & \text{if } (\mathit{cl\_default\_a} \equiv \texttt{UNINITIALIZED}) \ \{ \\ & \text{if } (\mathit{cl\_default\_mus} \equiv \texttt{UNINITIALIZED}) \ \mathit{r.a} = 0; \\ & \text{else if } (\mathit{cl\_default\_mua} \equiv \texttt{UNINITIALIZED}) \ \mathit{r.a} = 1; \\ & \text{else } \mathit{r.a} = \mathit{cl\_default\_mus}/(\mathit{cl\_default\_mua} + \mathit{cl\_default\_mus}); \\ & \} \\ & \text{else } \mathit{r.a} = \mathit{cl\_default\_a}; \\ & \text{See also sections } 7, 8, \text{ and } 9. \\ & \text{This code is used in section } 2. \end{split}
```

 $\S7$ IAD (v 3-11-6) MAIN PROGRAM 7

7. This is slightly more tricky because there are four things that can affect the optical thickness — $cl_default_b$, the default mua, default mus and the thickness. If the sample thickness is unspecified, then the only reasonable thing to do is to assume that the sample is very thick. Otherwise, we use the sample thickness to calculate the optical thickness.

```
\langle Calculate and Print the Forward Calculation 6\rangle + \equiv

 $\S11$ IAD (v 3-11-6) MAIN PROGRAM 9

11. Need to explicitly reset *r.search* each time through the loop, because it will get altered by the calculation process. We want to be able to let different lines have different constraints. In particular consider the file *newton.tst*. In that file the first two rows contain three real measurements and the last two have the collimated transmission explicitly set to zero — in other words there are really only two measurements.

§15 IAD (v 3-11-6) MAIN PROGRAM 11

Use Monte Carlo to figure out how much light leaks out. We use the sphere corrected values as the starting values and only do try Monte Carlo when spheres are used, the albedo unknown or non-zero, and there has been no error. The sphere parameters must be known because otherwise the beam size and the port size are unknown.

```

24 IAD TYPES IAD (v $_{3}$ -11-6) §31

31. IAD Types. This file has no routines. It is responsible for creating the header file iad_type.h and nothing else. Altered 3/3/95 to change the version number below. Change June 95 to improve cross referencing using CTwill. Change August 97 to add root finding with known absorption

32. These are the various optical properties that can be found with this program. FIND_AUTO allows one to let the computer figure out what it should be looking for.

These determine what metric is used in the minimization process.

These give the two different types of illumination allowed.

Finally, for convenience I create a Boolean type.

```
\langle iad\_type.h \quad 32 \rangle \equiv
#undef FALSE
#undef TRUE
  ⟨ Preprocessor definitions ⟩

```

39. All the information that needs to be written to the header file iad_pub.h. This eliminates the need to maintain a set of header files as well.

```
 \begin{split} \langle \operatorname{iad\_pub.h} & 39 \rangle \equiv \\ \langle \operatorname{Prototype} \text{ for } \operatorname{Inverse\_RT} \text{ } 41 \rangle; \\ \langle \operatorname{Prototype} \text{ for } \operatorname{measure\_OK} \text{ } 46 \rangle; \\ \langle \operatorname{Prototype} \text{ for } \operatorname{determine\_search} \text{ } 53 \rangle; \\ \langle \operatorname{Prototype} \text{ for } \operatorname{Initialize\_Result} \text{ } 57 \rangle; \\ \langle \operatorname{Prototype} \text{ for } \operatorname{Initialize\_Measure} \text{ } 63 \rangle; \\ \langle \operatorname{Prototype} \text{ for } \operatorname{Initialize\_Measure} \text{ } 65 \rangle; \\ \langle \operatorname{Prototype} \text{ for } \operatorname{Calculate\_MR\_MT} \text{ } 74 \rangle; \\ \langle \operatorname{Prototype} \text{ for } \operatorname{Calculate\_Minimum\_MR} \text{ } 76 \rangle; \\ \langle \operatorname{Prototype} \text{ for } \operatorname{Calculate\_Minimum\_MR} \text{ } 76 \rangle; \\ \langle \operatorname{Prototype} \text{ for } \operatorname{Spheres\_Inverse\_RT2} \text{ } 80 \rangle; \end{split}
```

40. Here is the header file needed to access one interesting routine in the libiad.so library.

```
⟨lib_iad.h 40⟩ ≡
  ⟨Prototype for ez_Inverse_RT 63⟩;
  ⟨Prototype for Spheres_Inverse_RT 67⟩;
  ⟨Prototype for Spheres_Inverse_RT2 80⟩;
```

 $\S41$ IAD (v 3-11-6) INVERSE RT 29

41. Inverse RT. $Inverse_RT$ is the main function in this whole package. You pass the variable m containing your experimentally measured values to the function $Inverse_RT$. It hopefully returns the optical properties in r that are appropriate for your experiment.

```
\langle Prototype for Inverse\_RT 41 \rangle \equiv
   void Inverse_RT(struct measure_type m, struct invert_type *r)
This code is used in sections 39 and 42.
42. \langle Definition for Inverse\_RT | 42 \rangle \equiv
   \langle Prototype for Inverse\_RT 41 \rangle
      if (0 \land Debug(DEBUG\_LOST\_LIGHT)) {
         fprintf(stderr, "** \bot Inverse_RT_{\sqcup}(%d_{\sqcup}spheres)_{\sqcup} ** \land ", m.num\_spheres);
         fprintf(stderr, "_{UUUUU}=_U%8.5f,_UMT_{UUUUUU}=_U%8.5f\\n", m.m_r, m.m_t);
         fprintf(stderr, "$\sqcup \sqcup \sqcup \sqcup UR1 \sqcup lost \sqcup = \sqcup \%8.5f, \sqcup UT1 \sqcup lost \sqcup = \sqcup \%8.5f \ ", m.ur1\_lost, m.ur1\_lost);
      r \rightarrow found = FALSE;
      if (r \rightarrow search \equiv FIND\_AUTO) r \rightarrow search = determine\_search(m, *r);
      if (r \rightarrow search \equiv FIND_B_WITH_NO_ABSORPTION) {
         r \rightarrow default_a = 1;
         r \rightarrow search = FIND_B;
      if (r \rightarrow search \equiv FIND_B_WITH_NO_SCATTERING) {
         r \rightarrow default_a = 0;
         r \rightarrow search = FIND_B;
      (Exit with bad input data 43)
      (Find the optical properties 44)
      if (r \rightarrow final\_distance \leq r \rightarrow tolerance) r \rightarrow found = TRUE;
This code is used in section 38.
```

43. There is no sense going to all the trouble to try a multivariable minimization if the input data is bogus. So I wrote a single routine $measure_OK$ to do just this.

```
\langle Exit with bad input data 43\rangle \equiv r \rightarrow \mathbf{error} = measure\_OK(m,*r); if (r\rightarrow method.quad\_pts < 4) r \rightarrow \mathbf{error} = \mathtt{IAD\_QUAD\_PTS\_NOT\_VALID}; if (r \rightarrow \mathbf{error} \neq \mathtt{IAD\_NO\_ERROR}) return; This code is used in section 42.
```

30 INVERSE RT IAD (v 3-11-6) $\S44$

44. Now I fob the real work off to the unconstrained minimization routines. Ultimately, I would like to replace all these by constrained minimization routines. Actually the first five already are constrained. The real work will be improving the last five because these are 2-D minimization routines.

```
\langle Find the optical properties 44 \rangle \equiv
  switch (r \rightarrow search) {
  case FIND_A: U_{-}Find_{-}A(m,r);
     break;
  case FIND_B: U_Find_B(m,r);
     break;
  case FIND_G: U_Find_G(m,r);
     break;
  case FIND\_Ba: U\_Find\_Ba(m,r);
     break;
  case FIND\_Bs: U\_Find\_Bs(m,r);
     break;
  case FIND_AB: U_Find_AB(m,r);
     break;
  case FIND_AG: U_Find_AG(m,r);
     break;
  case FIND_BG: U_Find_BG(m,r);
     break;
  case FIND\_BsG: U\_Find\_BsG(m,r);
  case FIND\_BaG: U\_Find\_BaG(m, r);
     break;
  if (r\text{-}iterations \equiv \texttt{IAD\_MAX\_ITERATIONS}) r \text{-} \mathbf{error} = \texttt{IAD\_TOO\_MANY\_ITERATIONS};
This code is used in section 42.
      Validation.
45.
      Now the question is — just what is bad data? Here's the prototype.
\langle \text{ Prototype for } measure\_OK \mid 46 \rangle \equiv
  int measure_OK(struct measure_type m, struct invert_type r)
This code is used in sections 39 and 47.
```

 $\S47$ IAD (v 3-11-6) VALIDATION 31

47. It would just be nice to stop computing with bad data. This does not work in practice because it turns out that there is often bogus data in a full wavelength scan. Often the reflectance is too low for short wavelengths and at long wavelengths the detector (photomultiplier tube) does not work worth a damn.

The two sphere checks are more complicated. For example, we can no longer categorically state that the transmittance is less than one or that the sum of the reflectance and transmittance is less than one. Instead we use the transmittance to bound the values for the reflectance — see the routine $MinMax_MR_MT$ below.

```
 \begin{tabular}{ll} $\langle \operatorname{Definition} \ & \operatorname{measure\_OK} \ 46 \end{tabular} = \\ & \langle \operatorname{Prototype} \ & \operatorname{for} \ & \operatorname{measure\_OK} \ 46 \end{tabular} = \\ & \langle \operatorname{Check} \ & \operatorname{MT} \ & \operatorname{for} \ & \operatorname{zero} \ & \operatorname{or} \ & \operatorname{one} \ & \operatorname{spheres} \ & 49 \end{tabular} \\ & \langle \operatorname{Check} \ & \operatorname{MR} \ & \operatorname{for} \ & \operatorname{zero} \ & \operatorname{or} \ & \operatorname{one} \ & \operatorname{spheres} \ & 48 \end{tabular} \\ & \rbrace \\ & \text{else} \ & \{ \ & \operatorname{int} \ & \operatorname{error} \ = \ & \operatorname{MinMax\_MR\_MT}(m,r); \ & \operatorname{if} \ & ( \ & \operatorname{error} \ \neq \ & \operatorname{IAD\_NO\_ERROR} \ ) \ & \operatorname{return} \ & \operatorname{error} \ ; \ \end{tabular} \ & \langle \operatorname{Check} \ & \operatorname{MU} \ & \operatorname{50} \end{tabular} \\ & \text{if} \ & (m.num\_spheres \ \neq 0) \ \ & \langle \operatorname{Check} \ & \operatorname{sphere} \ & \operatorname{parameters} \ & 51 \end{tabular} \\ & \rbrace \\ & \text{return} \ & \operatorname{IAD\_NO\_ERROR}; \ \end{tabular}
```

48. The reflectance is constrained by the index of refraction of the material and the transmission. The upper bound for the reflectance is just one minus the transmittance. The specular (unscattered) reflectance from the boundaries imposes minimum for the reflectance. Obviously, the reflected light cannot be less than that from the first boundary. This might be calculated by assuming an infinite layer thickness. But we can do better.

There is a definite bound on the minimum reflectance from a sample. If you have a sample with a given transmittance m_-t , the minimum reflectance possible is found by assuming that the sample does not scatter any light.

Knowledge of the indicies of refraction makes it a relatively simple matter to determine the optical thickness $b = mu_-a * d$ of the slab. The minimum reflection is obtained by including all the specular reflectances from all the surfaces.

If the default albedo has been specified as zero, then there is really no need to check MR because it is ignored.

```
 \begin{array}{l} \left\langle \text{Check MR for zero or one spheres } 48 \right\rangle \equiv \\ \left\{ & \text{double } mr, \ mt; \\ & \text{Calculate\_Minimum\_MR}(m,r,\&mr,\&mt); \\ & /* \ \text{one parameter search only needs one good measurement } */ \\ & \text{if } (r.search \equiv \text{FIND\_A} \lor r.search \equiv \text{FIND\_G} \lor r.search \equiv \text{FIND\_B} \lor r.search \equiv FIND\_Ba) \ \left\{ & \text{if } (m.m\_r < mr \land m.m\_t \leq 0) \ \text{return IAD\_MR\_TOO\_SMALL}; \\ \right\} & \text{else } \left\{ & \text{if } (r.default\_a \equiv \text{UNINITIALIZED} \lor r.default\_a > 0) \ \left\{ & \text{if } (m.m\_r < mr) \ \text{return IAD\_MR\_TOO\_SMALL}; \\ \right\} \\ & \right\} \\ \\ \end{array} \right\} \\ \text{This code is used in section } 47. \end{array}
```

32 ξ49 VALIDATION IAD (v 3-11-6)

The transmittance is also constrained by the index of refraction of the material. The minimum transmittance is zero, but the maximum transmittance cannot exceed the total light passing through the sample when there is no scattering or absorption. This is calculated by assuming an infinitely thin (to eliminate any scattering or absorption effects).

There is a problem when spheres are present. The estimated values for the transmittance using $Sp_{-}mu_{-}RT$ are not actually limiting cases. This will require a bit of fixing, but for now that test is omitted if the number of spheres is more than zero.

```
\langle Check MT for zero or one spheres 49 \rangle \equiv
         if (m.m_t < 0) return IAD_MT_TOO_SMALL;
         Sp\_mu\_RT\_Flip(m.flip\_sample, r.slab.n\_top\_slide, r.slab.n\_slab, r.slab.n\_bottom\_slide, r.slab.b\_top\_slide, 0,
                            r.slab.b_bottom_slide, r.slab.cos_angle, \&ru, \&tu);

```

 $\S53$ IAD (v 3-11-6) SEARCHING METHOD 33

53. Searching Method.

The original idea was that this routine would automatically determine what optical parameters could be figured out from the input data. This worked fine for a long while, but I discovered that often it was convenient to constrain the optical properties in various ways. Consequently, this routine got more and more complicated.

What should be done is to figure out whether the search will be 1D or 2D and split this routine into two parts.

It would be nice to enable the user to constrain two parameters, but the infrastructure is missing at this point.

```
\langle Prototype for determine\_search 53\rangle \equiv search_type determine\_search(struct measure_type m, struct invert_type r) This code is used in sections 39 and 54.
```

34 Searching method iad (v 3-11-6) §54

```

55. The fastest inverse problems are those in which just one measurement is known. This corresponds to a simple one-dimensional minimization problem. The only complexity is deciding exactly what should be allowed to vary. The basic assumption is that the anisotropy has been specified or will be assumed to be

If the anistropy is assumed known, then one other assumption will allow us to figure out the last parameter to solve for.

Ultimately, if no default values are given, then we look at the value of the total transmittance. If this is zero, then we assume that the optical thickness is infinite and solve for the albedo. Otherwise we will just make a stab at solving for the optical thickness assuming the albedo is one.

```
\langle \text{ One parameter search } 55 \rangle \equiv
  if (r.default_a \neq UNINITIALIZED) {
    if (r.default_a \equiv 0) search = FIND_B_WITH_NO_SCATTERING;
    else if (r.default_a \equiv 1) search = FIND_B_WITH_NO_ABSORPTION;
    else if (tt \equiv 0) search = FIND_G;
    else search = FIND_B;
  }
  else if (r.default_b \neq UNINITIALIZED) search = FIND_A;
  else if (r.default\_bs \neq UNINITIALIZED) search = FIND\_Ba;
  else if (r.default\_ba \neq UNINITIALIZED) search = FIND\_Bs;
  else if (td \equiv 0) search = FIND_A;
  else if (rd \equiv 0) search = FIND_B_WITH_NO_SCATTERING;
  else search = FIND_B_WITH_NO_ABSORPTION;
```

This code is used in section 54.

36 Searching method iad (v 3-11-6) §56

56. If the absorption depth $\mu_a d$ is constrained return $FIND_BsG$. Recall that I use the bizarre mnemonic $bs = \mu_s d$ here and so this means that the program will search over various values of $\mu_s d$ and g.

If there are just two measurements then I assume that the anisotropy is not of interest and the only thing to calculate is the reduced albedo and optical thickness based on an assumed anisotropy.

```
\langle Two parameter search 56\rangle \equiv
  if (r.default_a \neq UNINITIALIZED) {
     if (r.default_a \equiv 0) search = FIND_B;
     else if (r.default_g \neq UNINITIALIZED) search = FIND_B;
     else search = FIND_BG;
  else if (r.default_b \neq UNINITIALIZED) {
     if (r.default\_g \neq UNINITIALIZED) search = FIND_A;
     \mathbf{else} \ \mathit{search} = \mathtt{FIND\_AG};
  else if (r.default_ba \neq UNINITIALIZED) {
    if (r.default\_q \neq UNINITIALIZED) search = FIND\_Bs;
     else search = FIND\_BsG;
  else if (r.default_bs \neq \texttt{UNINITIALIZED}) {
    if (r.default\_g \neq UNINITIALIZED) search = FIND\_Ba;
     else search = FIND\_BaG;

63. EZ Inverse RT. *ez_Inverse_RT* is a simple interface to the main function *Inverse_RT* in this package. It eliminates the need for complicated data structures so that the command line interface (as well as those to Perl and Mathematica) will be simpler. This function assumes that the reflection and transmission include specular reflection and that the transmission also include unscattered transmission.

Other assumptions are that the top and bottom slides have the same index of refraction, that the illumination is collimated. Of course no sphere parameters are included.

```

78. The minimum possible value of MR for a given MT will be when the albedo is zero and the maximum value will be when the albedo is one. In the first case there will be no light loss and in the second we will assume that any light loss is neglible (to maximize MR).

The second case is perhaps over-simplified. Obviously for a fixed thickness as the albedo increases, the reflectance will increase. So how does $U_Find_B()$ work when the albedo is set to 1?

The problem is that to calculate these values one must know the optical thickness. Fortunately with the recent addition of constrained minimization, we can do exactly this.

The only thing that remains is to sort out the light lost effect.

113. Initialization.

The functions in this file assume that the local variables MM and RR have been initialized appropriately. The variable MM contains all the information about how a particular experiment was done. The structure RR contains the data structure that is passed to the adding-doubling routines as well as the number of quadrature points.

history 6/8/94 changed error output to stderr.

114. Gain.

Assume that a sphere is illuminated with diffuse light having a power P. This light can reach all parts of sphere — specifically, light from this source is not blocked by a baffle. Multiple reflections in the sphere will increase the power falling on non-white areas in the sphere (e.g., the sample, detector, and entrance) To find the total we need to sum all the total of all incident light at a point. The first incidence is

$$P_w^{(1)} = a_w P, \qquad P_s^{(1)} = a_s P, \qquad P_d^{(1)} = a_d P$$

The light from the detector and sample is multiplied by $(1 - a_e)$ and not by a_w because the light from the detector (and sample) is not allowed to hit either the detector or sample. The second incidence on the wall is

$$P_w^{(2)} = a_w r_w P_w^{(1)} + (1 - a_e) r_d P_d^{(1)} + (1 - a_e) r_s P_s^{(1)}$$

The light that hits the walls after k bounces has the same form as above

$$P_w^{(k)} = a_w r_w P_w^{(k-1)} + (1 - a_e) r_d P_d^{(k-1)} + (1 - a_e) r_s P_s^{(k-1)}$$

Since the light falling on the sample and detector must come from the wall

$$P_s^{(k)} = a_s r_w P_w^{(k-1)}$$
 and $P_d^{(k)} = a_d r_w P_w^{(k-1)}$,

Therefore,

$$P_w^{(k)} = a_w r_w P_w^{(k-1)} + (1 - a_e) r_w (a_d r_d + a_s r_s) P_w^{(k-2)}$$

The total power falling on the walls is just

$$P_w = \sum_{k=1}^{\infty} P_w^{(k)} = \frac{a_w + (1 - a_e)(a_d r_d + a_s r_s)}{1 - a_w r_w - (1 - a_e)r_w(a_d r_d + a_s r_s)} P$$

The total power falling the detector is

$$P_d = a_d P + \sum_{k=2}^{\infty} a_d r_w P_w^{(k-1)} = a_d P + a_d r_w P_w$$

The gain $G(r_s)$ on the irradiance on the detector (relative to a black sphere),

$$G(r_s) \equiv \frac{P_d/A_d}{P/A}$$

in terms of the sphere parameters

$$G(r_s) = 1 + \frac{1}{a_w} \cdot \frac{a_w r_w + (1 - a_e) r_w (a_d r_d + a_s r_s)}{1 - a_w r_w - (1 - a_e) r_w (a_d r_d + a_s r_s)}$$

The gain for a detector in a transmission sphere is similar, but with primed parameters to designate a second potential sphere that is used. For a black sphere the gain G(0) = 1, which is easily verified by setting $r_w = 0$, $r_s = 0$, and $r_d = 0$. Conversely, when the sphere walls and sample are perfectly white, the irradiance at the entrance port, the sample port, and the detector port must increase so that the total power leaving via these ports is equal to the incident diffuse power P. Thus the gain should be the ratio of the sphere wall area over the area of the ports through which light leaves or $G(1) = A/(A_e + A_d)$ which follows immediately from the gain formula with $r_w = 1$, $r_s = 1$, and $r_d = 0$.

 $\S115$ IAD (v 3-11-6) GAIN 59

115. The gain $G(r_s)$ on the irradiance on the detector (relative to a black sphere),

$$G(r_s) \equiv \frac{P_d/A_d}{P/A}$$

in terms of the sphere parameters

$$G(r_s) = 1 + \frac{a_w r_w + (1 - a_e) r_w (a_d r_d + a_s r_s)}{1 - a_w r_w - (1 - a_e) r_w (a_d r_d + a_s r_s)}$$

 $\langle \text{ Prototype for } Gain | 115 \rangle \equiv$

double Gain(int sphere, struct measure_type m, double URU)

This code is used in sections 112 and 116.

```
116. 〈 Definition for Gain \ 116〉 \equiv 〈 Prototype for Gain \ 115〉 { double G, \ tmp; if (sphere \equiv \texttt{REFLECTION\_SPHERE}) { tmp = m.rw\_r * (m.aw\_r + (1 - m.ae\_r) * (m.ad\_r * m.rd\_r + m.as\_r * \texttt{URU})); if (tmp \equiv 1.0) \ G = 1; else G = 1.0 + tmp/(1.0 - tmp); } else { tmp = m.rw\_t * (m.aw\_t + (1 - m.ae\_t) * (m.ad\_t * m.rd\_t + m.as\_t * \texttt{URU})); if (tmp \equiv 1.0) \ G = 1; else G = 1.0 + tmp/(1.0 - tmp); } return G; }
```

This code is used in section 111.

117. The gain for light on the detector in the first sphere for diffuse light starting in that same sphere is defined as

$$G_{1\to 1}(r_s, t_s) \equiv \frac{P_{1\to 1}(r_s, t_s)/A_d}{P/A}$$

then the full expression for the gain is

$$G_{1\to 1}(r_s, t_s) = \frac{G(r_s)}{1 - a_s a_s' r_w r_w' (1 - a_e) (1 - a_e') G(r_s) G'(r_s) t_s^2}$$

 $\langle \text{ Prototype for } Gain_{-}11 \text{ 117} \rangle \equiv$

double Gain_11 (struct measure_type m, double URU, double tdiffuse)

This code is used in sections 112 and 118.

60 GAIN IAD (v 3-11-6) $\S 118$

119. Similarly, when the light starts in the second sphere, the gain for light on the detector in the second sphere $G_{2\to 2}$ is found by switching all primed variables to unprimed. Thus $G_{2\to 1}(r_s, t_s)$ is

$$G_{2\to 2}(r_s, t_s) = \frac{G'(r_s)}{1 - a_s a_s' r_w r_w' (1 - a_e) (1 - a_e') G(r_s) G'(r_s) t_s^2}$$

 $\langle \text{ Prototype for } Gain_{-}22 \text{ 119} \rangle \equiv$

This code is used in section 111.

double Gain_22 (struct measure_type m, double URU, double tdiffuse)

This code is used in sections 112 and 120.

```
120. \langle Definition for Gain\_22\ 120 \rangle \equiv \langle Prototype for Gain\_22\ 119 \rangle = \langle double G, GP, G22; G = Gain(\texttt{REFLECTION\_SPHERE}, m, \texttt{URU}); \\ \texttt{GP} = Gain(\texttt{TRANSMISSION\_SPHERE}, m, \texttt{URU}); \\ \texttt{G22} = \texttt{GP}/(1-m.as\_r*m.as\_t*m.aw\_r*m.aw\_t*(1-m.ae\_r)*(1-m.ae\_t)*G*\texttt{GP}*tdiffuse*tdiffuse); \\ \texttt{return G22}; \\ \}
```

121. The reflected power for two spheres makes use of the formulas for Gain_11 above.

The light on the detector in the reflection (first) sphere arises from three sources: the fraction of light directly reflected off the sphere wall $fr_w^2(1-a_e)P$, the fraction of light reflected by the sample $(1-f)r_s^{\text{direct}}r_w^2(1-a_e)P$, and the light transmitted through the sample $(1-f)t_s^{\text{direct}}r_w'(1-a_e')P$,

$$\begin{split} R(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) &= G_{1 \to 1}(r_s, t_s) \cdot a_d (1 - a_e) r_w^2 f P \\ &+ G_{1 \to 1}(r_s, t_s) \cdot a_d (1 - a_e) r_w (1 - f) r_s^{\text{direct}} P \\ &+ G_{2 \to 1}(r_s, t_s) \cdot a_d (1 - a_e') r_w' (1 - f) t_s^{\text{direct}} P \end{split}$$

which simplifies slightly to

This code is used in section 111.

$$\begin{split} R(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) &= a_d (1 - a_e) r_w P \cdot G_{1 \rightarrow 1}(r_s, t_s) \\ &\times \left[(1 - f) r_s^{\text{direct}} + f r_w + (1 - f) a_s' (1 - a_e') r_w' t_s^{\text{direct}} t_s G'(r_s) \right] \end{split}$$

 $\langle \text{ Prototype for } Two_Sphere_R \ 121 \rangle \equiv$

double $Two_Sphere_R($ struct measure_type m, double UR1, double URU, double UT1, double UTU) This code is used in sections 112 and 122.

 $\{122 \text{ IAD (v } 3-11-6)\}$ GAIN 61

```
122. \langle Definition for Two\_Sphere\_R 122\rangle \equiv \langle Prototype for Two\_Sphere\_R 121\rangle \{ double x, GP; GP = Gain(TRANSMISSION\_SPHERE, m, URU); x = m.ad\_r * (1 - m.ae\_r) * m.rw\_r * <math>Gain\_11(m, URU, UTU); x *= (1 - m.f\_r) * UR1 + m.rw\_r * m.f\_r + (1 - m.f\_r) * m.as\_t * (1 - m.ae\_t) * m.rw\_t * UT1 * UTU * GP; return x; \} This code is used in section 111.
```

123. For the power on the detector in the transmission (second) sphere we have the same three sources. The only difference is that the subscripts on the gain terms now indicate that the light ends up in the second sphere

$$\begin{split} T(r_s^{\text{ direct}}, r_s, t_s^{\text{ direct}}, t_s) &= G_{1 \rightarrow 2}(r_s, t_s) \cdot a_d'(1 - a_e) r_w^2 f P \\ &+ G_{1 \rightarrow 2}(r_s, t_s) \cdot a_d'(1 - a_e) r_w (1 - f) r_s^{\text{ direct}} P \\ &+ G_{2 \rightarrow 2}(r_s, t_s) \cdot a_d'(1 - a_e') r_w'(1 - f) t_s^{\text{ direct}} P \end{split}$$

or

124. \langle Definition for Two\_Sphere\_T 124\rangle \equiv \langle Prototype for Two\_Sphere\_T 123\rangle \{ double x, G; G = Gain(\texttt{REFLECTION\_SPHERE}, m, \texttt{URU}); x = m.ad\_t * (1 - m.ae\_t) * m.rw\_t * Gain\_22(m, \texttt{URU}, \texttt{UTU}); x *= (1 - m.f\_r) * \texttt{UT1} + (1 - m.ae\_r) * m.rw\_r * m.as\_r * \texttt{UTU} * (m.f\_r * m.rw\_r + (1 - m.f\_r) * \texttt{UR1}) * G; return x; \}
```

125. Grid Routines. There is a long story associated with these routines. I spent a lot of time trying to find an empirical function to allow a guess at a starting value for the inversion routine. Basically nothing worked very well. There were too many special cases and what not. So I decided to calculate a whole bunch of reflection and transmission values and keep their associated optical properties linked nearby.

I did the very simplest thing. I just allocate a matrix that is five columns wide. Then I fill every row with a calculated set of optical properties and observables. The distribution of values that I use could certainly use some work, but they currently work.

SO... how does this thing work anyway? There are two possible grids one for calculations requiring the program to find the albedo and the optical depth (a and b) and one to find the albedo and anisotropy (a and g). These grids must be allocated and initialized before use.

62 GRID ROUTINES IAD (v 3-11-6) §126

126. This is a pretty important routine that should have some explanation. The reason that it exists, is that we need some 'out-of-band' information during the minimization process. Since the light transport calculation depends on all sorts of stuff (e.g., the sphere parameters) and the minimization routines just vary one or two parameters this information needs to be put somewhere.

I chose the global variables MM and RR to save things in.

The bottom line is that you cannot do a light transport calculation without calling this routine first.

```
void Set_Calc_State(struct measure_type m, struct invert_type r)
```

This code is used in sections 112 and 127.

This code is used in section 111.

136. This routine is used to figure out if the current grid is valid. This can fail for several reasons. First the grid may not have been allocated. Or it may not have been initialized. The boundary conditions may have changed. The number or values of the sphere parameters may have changed. It is tedious, but straightforward to check these cases out.

If this routine returns true, then it is a pretty good bet that the values in the current grid can be used to guess the next starting set of values.

```

146. Routine to incorporate flipping of sample if needed. This is pretty simple. The assumption is that flipping is handled relative to the reflection side of the sphere. Thus even when flipping is needed, the usual call to RT() will result in the correct values for the reflectances. The transmission values can then be calculated by swapping the top and bottom slides.

Technically, the value of slab should be **const** but it is not so that we don't pay a copying overhead whenever *flip* is false (the usual case).

```
\langle \text{Prototype for } RT\_Flip \mid 146 \rangle \equiv

This code is used in section 111.
```

149. This routine fills the grid with a proper set of values. With a little work, this routine could be made much faster by (1) only generating the phase function matrix once, (2) Making only one pass through the array for each albedo value, i.e., using the matrix left over from b = 1 to generate the solution for b = 2. Unfortunately this would require a complete revision of the *Calculate_Distance* routine. Fortunately, this routine should only need to be calculated once at the beginning of each run.

```

```

151. Now it seems that I must be a bit more subtle in choosing the range of albedos to use in the grid. Originally I just spaced them according to

$$a = 1 - \left[\frac{j-1}{n-1}\right]^3$$

where $1 \le j \le n$. Long ago it seems that I based things only on the square of the bracketed term, but I seem to remember that I was forced to change it from a square to a cube to get more global convergence.

So why am I rewriting this? Well, because it works very poorly for samples with small albedos. For example, when n = 11 then the values chosen for a are (1, .999, .992, .973, .936, .875, .784, .657, .488, .271, 0). Clearly very skewed towards high albedos.

I am considering a two part division. I'm not too sure how it should go. Let the first half be uniformly divided and the last half follow the cubic scheme given above. The list of values should then be (1, .996, .968, .892, 0.744, .5, .4, .3, .2, .1, 0).

Maybe it would be best if I just went back to a quadratic term. Who knows?

In the **if** statement below, note that it could read $j \geq k$ and still generate the same results.

```
 \begin{split} &\langle \, \text{Nonworking code 151} \, \rangle \equiv \\ &k = floor((\texttt{GRID\_SIZE} - 1)/2); \\ &\textbf{if } (j > k) \, \, \{ \\ &a = 0.5 * (1 - (j - k - 1)/(\texttt{GRID\_SIZE} - k - 1)); \\ &\texttt{RR}.slab.a = a; \\ &\} \\ &\textbf{else } \, \{ \\ &a = (j - 1.0)/(\texttt{GRID\_SIZE} - k - 1); \\ &\texttt{RR}.slab.a = 1.0 - a * a * a/2; \\ &\} \end{split}
```

 $\S152$ IAD (v 3-11-6) GRID ROUTINES 71

152. Well, the above code did not work well. So I futzed around and sort of empirically ended up using the very simple method below. The only real difference from the previous method what that the method is now quadratic and not cubic.

This code is used in sections 100 and 100.

153. Well, the above code has gaps. Here is an attempt to eliminate the gaps

```
 \begin{split} &\langle \, \text{Generate next albedo using j 152} \, \rangle + \equiv \\ &a = (\mathbf{double}) \ j / (\texttt{GRID\_SIZE} - 1.0); \\ &\texttt{RR}.slab.a = (1.0 - a*a)*(1.0 - a) + (1.0 - a)*(1.0 - a)*a; \end{split}
```

154. This is quite similar to $Fill_AB_Grid$, with the exception of the little shuffle I do at the beginning to figure out the optical thickness to use. The problem is that the optical thickness may not be known. If it is known then the only way that we could have gotten here is if the user dictated FIND_AG and specified b and only provided two measurements. Otherwise, the user must have made three measurements and the optical depth can be figured out from $m.m_u$.

This routine could also be improved by not recalculating the anisotropy matrix for every point. But this would only end up being a minor performance enhancement if it were fixed.

```

 $\S169$ IAD (v 3-11-6) CALCULATING R AND T

169. This is the routine that actually finds the distance. I have factored this part out so that it can be used in the *Near_Grid_Point* routine.

Rc and Tc refer to the unscattered (collimated) reflection and transmission.

The only tricky part is to remember that the we are trying to match the measured values. The measured values are affected by sphere parameters and light loss. Since the values UR1 and UT1 are for an infinite slab sample with no light loss, the light loss out the edges must be subtracted. It is these values that are used with the sphere formulas to convert the modified UR1 and UT1 to values for *M_R and *M_T.

```
 \begin{tabular}{ll} $\langle$ Prototype for $\mathit{Calculate\_Distance\_With\_Corrections}$ & 169$ $\rangle$ & \\ & \textbf{void} $\mathit{Calculate\_Distance\_With\_Corrections}$ & \textbf{(double UR1, double UT1, double } \mathit{Rc, double } \mathit{Tc, double } \mathit{Tc, double } \mathit{MLT, double } \mathit{MLT,
```

This code is used in sections 112 and 170.

```
\langle Definition for Calculate\_Distance\_With\_Corrections 170 \rangle \equiv
  ⟨ Prototype for Calculate_Distance_With_Corrections 169⟩
     double R_direct, T_direct, R_diffuse, T_diffuse;
     R\_diffuse = URU - MM.uru\_lost;
     T_{-}diffuse = UTU - MM.utu_{-}lost;
     R\_direct = UR1 - MM.ur1\_lost - (1.0 - MM.fraction\_of\_rc\_in\_mr) * Rc;
     T\_direct = \mathtt{UT1} - \mathtt{MM}.ut1\_lost - (1.0 - \mathtt{MM}.fraction\_of\_tc\_in\_mt) * Tc;
     switch (MM. num_spheres) {

     (Calculate the deviation 175)
     (Print diagnostics 178)
This code is used in section 111.
```

171. If no spheres were used in the measurement, then presumably the measured values are the reflection and transmission. Consequently, we just acertain what the irradiance was and whether the specular reflection ports were blocked and proceed accordingly. Note that blocking the ports does not have much meaning unless the light is collimated, and therefore the reflection and transmission is only modified for collimated irradiance.

```
\langle Calc M_R and M_T for no spheres 171\rangle \equiv *M_R = R\_direct; *M_T = T\_direct; This code is used in section 170.
```

The direct incident power is (1-f)P. The reflected power will be $(1-f)r_s^{\text{direct}}P$. Since baffles ensure that the light cannot reach the detector, we must bounce the light off the sphere walls to use to above gain formulas. The contribution will then be $(1-f)r_s^{\text{direct}}(1-a_e)r_wP$. The measured power will be

$$P_d = a_d(1 - a_e)r_w[(1 - f)r_s^{\text{direct}} + fr_w]P \cdot G(r_s)$$

Similarly the power falling on the detector measuring transmitted light is

$$P'_d = a'_d t_s^{\text{direct}} r'_w (1 - a'_e) P \cdot G'(r_s)$$

when the 'entrance' port in the transmission sphere is closed, $a'_e = 0$. The normalized sphere measurements are

$$M_R = r_{\text{std}} \cdot \frac{R(r_s^{\text{direct}}, r_s) - R(0, 0)}{R(r_{\text{std}}, r_{\text{std}}) - R(0, 0)}$$

and

78

$$M_T = t_{\text{std}} \cdot \frac{T(t_s^{\text{direct}}, r_s) - T(0, 0)}{T(t_{\text{std}}, r_{\text{std}}) - T(0, 0)}$$

```
\langle \text{Calc M\_R and M\_T for single beam sphere } 172 \rangle \equiv
     double P_{-}std, P_{-}d, P_{-}0;
     double G, G_{-}0, G_{-}std, GP_{-}std, GP;
     G_0 = Gain(REFLECTION\_SPHERE, MM, 0.0);
     G = Gain(REFLECTION\_SPHERE, MM, R\_diffuse);
     G_{-}std = Gain(REFLECTION\_SPHERE, MM, MM.rstd_r);
     P_{-}d = G * (R_{-}direct * (1 - MM.f_{-}r) + MM.f_{-}r * MM.rw_{-}r);
     P\_std = G\_std * (\texttt{MM}.rstd\_r * (1 - \texttt{MM}.f\_r) + \texttt{MM}.f\_r * \texttt{MM}.rw\_r);
     P_0 = G_0 * (MM.f_r * MM.rw_r);
     *M_R = MM.rstd_r * (P_d - P_0)/(P_std - P_0);
     GP = Gain(TRANSMISSION\_SPHERE, MM, R\_diffuse);
     GP_{-}std = Gain(TRANSMISSION\_SPHERE, MM, 0.0);
     *M_T = T_direct * GP/GP_std;
  }
```

This code is used in section 170.

173. The dual beam case is different because the sphere efficiency is equivalent for measurement of light hitting the sample first or hitting the reference standard first. The dual beam measurement should report the ratio of these two reflectance measurements, thereby eliminating the need to calculate the gain completely. The same holds when no sample is present.

The normalized reflectance measurement (the difference between dual beam measurement for a port with the sample and with nothing) is

$$M_R = r_{\rm std} \cdot \frac{(1-f)r_s^{\rm direct} + fr_w}{(1-f')r_{\rm std} - f'r_w} - r_{\rm std} \cdot \frac{(1-f)(0) + fr_w}{(1-f')r_{\rm std} - f'r_w}$$

or

$$M_R = \frac{(1-f)r_s^{\text{direct}}}{(1-f') - f'r_w/r_{\text{std}}}$$

When f = f' = 1, then $M_R = 1$ no matter what the reflectance is. (Leave it in this form to avoid division by zero when f = 1.)

The normalized transmittance is simply t_s^{direct} .

When f = 0 then this result is essentially the same as the no spheres result (because no sphere corrections are needed). However if the number of spheres is zero, then no lost light calculations are made and therefore that is a potential error.

This code is used in section 170.

174. When two integrating spheres are present then the double integrating sphere formulas are slightly more complicated.

I am not sure what it means when $rstd_{-}t$ is not unity.

The normalized sphere measurements for two spheres are

$$M_R = \frac{R(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) - R(0, 0, 0, 0)}{R(r_{\text{std}}, r_{\text{std}}, 0, 0) - R(0, 0, 0, 0)}$$

and

$$M_T = \frac{T(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) - T(0, 0, 0, 0)}{T(0, 0, 1, 1) - T(0, 0, 0, 0)}$$

Note that R_0 and T_0 will be zero unless one has explicitly set the fraction $m.f_-r$ ore $m.f_-t$ to be non-zero. $\langle \text{Calc M}_-\text{R} \text{ and M}_-\text{T} \text{ for two spheres } 174 \rangle \equiv$

This code is used in section 170.

80 CALCULATING R AND T IAD (v 3-11-6) $\S175$

175. There are at least three things that need to be considered here. First, the number of measurements. Second, is the metric is relative or absolute. And third, is the albedo fixed at zero which means that the transmission measurement should be used instead of the reflection measurement.

```
⟨ Calculate the deviation 175⟩ ≡
if (RR.search ≡ FIND_A ∨ RR.search ≡ FIND_G ∨ RR.search ≡ FIND_B ∨ RR.search ≡ FIND_Bs ∨ RR.search ≡
FIND_Ba) {
  ⟨One parameter deviation 176⟩
}
else {
  ⟨Two parameter deviation 177⟩
}
This code is used in section 170.
```

176. This part was slightly tricky. The crux of the problem was to decide if the transmission or the reflection was trustworthy. After looking a bunches of measurements, I decided that the transmission measurement was almost always more reliable. So when there is just a single measurement known, then use the total transmission if it exists.

```
 \langle \text{One parameter deviation } 176 \rangle \equiv \\ \text{if } (\texttt{MM}.m\_t > 0) \; \{ \\ \text{if } (\texttt{RR}.metric \equiv \texttt{RELATIVE}) \; *dev = fabs(\texttt{MM}.m\_t - *\texttt{M\_T})/(\texttt{MM}.m\_t + \texttt{ABIT}); \\ \text{else } *dev = fabs(\texttt{MM}.m\_t - *\texttt{M\_T}); \\ \} \\ \text{else } \{ \\ \text{if } (\texttt{RR}.metric \equiv \texttt{RELATIVE}) \; *dev = fabs(\texttt{MM}.m\_r - *\texttt{M\_R})/(\texttt{MM}.m\_r + \texttt{ABIT}); \\ \text{else } *dev = fabs(\texttt{MM}.m\_r - *\texttt{M\_R}); \\ \} \\ \text{This code is used in section } 175.
```

177. This stuff happens when we are doing two parameter searches. In these cases there should be information in both R and T. The distance should be calculated using the deviation from both. The albedo stuff might be able to be take out. We'll see.

```
 \begin{array}{l} \langle \, {\rm Two \; parameter \; deviation \; 177} \, \rangle \equiv \\ & \quad {\rm if \; (RR.} metric \equiv {\rm RELATIVE}) \; \left\{ \\ & \quad *dev = 0; \\ & \quad {\rm if \; (MM.} m_-t > {\rm ABIT}) \; *dev = {\rm T\_TRUST\_FACTOR} * fabs({\rm MM.} m_-t - *{\rm M\_T})/({\rm MM.} m_-t + {\rm ABIT}); \\ & \quad {\rm if \; (RR.} default_-a \neq 0) \; *dev \; += fabs({\rm MM.} m_-r - *{\rm M\_R})/({\rm MM.} m_-r + {\rm ABIT}); \\ & \quad {\rm else \; \{} \\ & \quad *dev = {\rm T\_TRUST\_FACTOR} * fabs({\rm MM.} m_-t - *{\rm M\_T}); \\ & \quad {\rm if \; (RR.} default_-a \neq 0) \; *dev \; += fabs({\rm MM.} m_-r - *{\rm M\_R}); \\ & \quad {\rm \}} \end{array}
```

This code is used in section 175.

This is here so that I can figure out why the program is not converging. This is a little convoluted so that the global constants at the top of this file interact properly. $\langle \text{Print diagnostics } 178 \rangle \equiv$ if $((Debuq(DEBUG_ITERATIONS) \land \neg CALCULATING_GRID) \lor (Debuq(DEBUG_GRID_CALC) \land CALCULATING_GRID))$ static int once = 0; if $(once \equiv 0)$ { $fprintf(stderr, "\%10s_{\sqcup}\%10s_{\sqcup}\%10s_{\sqcup}\%10s_{\sqcup})\%10s_{\sqcup}\%10s_{\sqcup}\%10s_{\sqcup}\%10s_{\sqcup}\%10s_{\sqcap}, "a", "b", "g", "m_r", "fit", %fit", %fit"$ "m_t", "fit", "delta"); once = 1; $fprintf(stderr, "\%10.5f_{\square}\%10.5f_{\square}\%10.5f_{\square}", RR.slab.a, RR.slab.b, RR.slab.g);$ $fprintf(stderr, "\%10.5f_{\square}\%10.5f_{\square}|", MM.m_r, *M_R);$ $fprintf(stderr, "\%10.5f_{\square}\%10.5f_{\square}|", MM.m_{-}t, *M_T);$ $fprintf(stderr, "\%10.5f_{\square}\n", *dev);$ This code is used in section 170. $\langle \text{Prototype for } Find_AG_fn \mid 179 \rangle \equiv$ **double** $Find_AG_fn($ **double** x[])This code is used in sections 112 and 180. **180.** $\langle \text{ Definition for } Find_AG_fn \text{ 180} \rangle \equiv$ $\langle \text{ Prototype for } Find_AG_fn \ 179 \rangle$ **double** $m_{-}r$, $m_{-}t$, deviation; RR.slab.a = acalc2a(x[1]);RR.slab.g = gcalc2g(x[2]); $Calculate_Distance(\&m_r,\&m_t,\&deviation);$ return deviation; This code is used in section 111. **181.** $\langle \text{Prototype for } Find_AB_fn \ 181 \rangle \equiv$ **double** $Find_AB_fn($ **double** x[])This code is used in sections 112 and 182. **182.** $\langle \text{ Definition for } Find_AB_fn \text{ 182} \rangle \equiv$ $\langle \text{ Prototype for } Find_AB_fn \text{ 181} \rangle$ **double** $m_{-}r$, $m_{-}t$, deviation; RR.slab.a = acalc2a(x[1]);RR.slab.b = bcalc2b(x[2]); $Calculate_Distance(\&m_r,\&m_t,\&deviation);$ **return** deviation; This code is used in section 111.

```

215. Fixed Absorption and Anisotropy. Typically, this routine is called when the absorption coefficient is known, the anisotropy is known, and the physical thickness of the sample is known. This routine calculates the varies the scattering coefficient until the measurements are matched.

This was written for Ted Moffitt to analyze some intralipid data. We wanted to know what the scattering coefficient of the Intralipid was and made total transmission measurements through a sample with a fixed physical thickness. We did not make reflection measurements because the light source diverged too much, and we could not make reflection measurements easily.

In retrospect, we could have made URU measurements by illuminating the wall of the integrating sphere. However, these diffuse type of measurements are very difficult to make accurately.

This is tricky only because the value in slab.b is used to hold the value of ba or $d \cdot \mu_a$ when the $Find_Bs_fn$ is used.

```

```

219. Fixed Optical Depth and Anisotropy. Typically, this routine is called when the optical thickness is assumed infinite. However, it may also be called when the optical thickness is assumed to be fixed at a particular value. Typically the only reasonable situation for this to occur is when the diffuse transmission is non-zero but the collimated transmission is zero. If this is the case then there is no information in the collimated transmission measurement and there is no sense even using it because the slab is not infinitely thick.

226. Fixed Optical Depth.
  We can get here a couple of different ways.
  First there can be three real measurements, i.e., t_c is not zero, in this case we want to fix b based on the
t_c measurement.
  Second, we can get here if a default value for b has been set.
  Otherwise, we really should not be here. Just set b = 1 and calculate away.

249. Finding optical thickness.

This routine figures out what the optical thickness of a slab based on the index of refraction of the slab and the amount of collimated light that gets through it.

It should be pointed out right here in the front that this routine does not work for diffuse irradiance, but then the whole concept of estimating the optical depth for diffuse irradiance is bogus anyway.

In version 1.3 changed all error output to *stderr*. Version 1.4 included cases involving absorption in the boundaries.

```
#define BIG_A_VALUE 999999.0
#define SMALL_A_VALUE 0.000001

⟨Prototype for What_Is_B 249⟩ ≡
    double What_Is_B (struct AD_slab_type slab, double Tc)

This code is used in sections 248 and 250.

250. ⟨Definition for What_Is_B 250⟩ ≡
    ⟨Prototype for What_Is_B 249⟩
    {
        double r1, r2, t1, t2, mu_in_slab;
        ⟨Calculate specular reflection and transmission 251⟩
        ⟨Check for bad values of Tc 252⟩
        ⟨Solve if multiple internal reflections are not present 253⟩
        ⟨Find thickness when multiple internal reflections are present 254⟩
    }

This code is used in section 247.
```

251. The first thing to do is to find the specular reflection for light interacting with the top and bottom airglass-sample interfaces. I make a simple check to ensure that the indices are different before calculating the bottom reflection. Most of the time the $r1 \equiv r2$, but there are always those annoying special cases.

```
 \begin{array}{l} \langle \, \text{Calculate specular reflection and transmission } \, 251 \, \rangle \equiv \\ \, Absorbing\_Glass\_RT \, (1.0, slab.n\_top\_slide, slab.n\_slab, slab.cos\_angle, slab.b\_top\_slide, \&r1\,,\&t1 \, ); \\ \, mu\_in\_slab = \, Cos\_Snell \, (1.0, slab.cos\_angle, slab.n\_slab); \\ \, Absorbing\_Glass\_RT \, (slab.n\_slab, slab.n\_bottom\_slide, 1.0, mu\_in\_slab, slab.b\_bottom\_slide, \&r2\,,\&t2 \, ); \\ \, \text{This code is used in section } 250. \end{array}
```

This code is used in section 250.

252. Bad values for the unscattered transmission are those that are non-positive, those greater than one, and those greater than are possible in a non-absorbing medium, i.e.,

$$T_c > \frac{t_1 t_2}{1 - r_1 r_2}$$

Since this routine has no way to report errors, I just set the optical thickness to the natural values in these cases.

 $\begin{array}{l} \langle \, \text{Check for bad values of} \, \, \textit{Tc} \, \, 252 \, \rangle \equiv \\ & \quad \text{if} \, \, (\textit{Tc} \leq 0) \, \, \, \text{return} \, \, (\texttt{HUGE_VAL}); \\ & \quad \text{if} \, \, (\textit{Tc} \geq t\textit{1} * t\textit{2} / (1 - r\textit{1} * r\textit{2})) \, \, \, \text{return} \, \, (0.001); \end{array}$

253. If either r1 or $r2 \equiv 0$ then things are very simple because the sample does not sustain multiple internal reflections and the unscattered transmission is

$$T_c = t_1 t_2 \exp(-b/\nu)$$

where b is the optical thickness and ν is slab.cos_angle. Clearly,

$$b = -\nu \ln \left(\frac{T_c}{t_1 t_2}\right)$$

 \langle Solve if multiple internal reflections are not present $253\rangle \equiv$ if $(r1 \equiv 0 \lor r2 \equiv 0)$ return $(-slab.cos_angle * log(Tc/t1/t2))$; This code is used in section 250.

254. Well I kept putting it off, but now comes the time to solve the following equation for b

$$T_c = \frac{t_1 t_2 \exp(-b)}{1 - r_1 r_2 \exp(-2b)}$$

We note immediately that this is a quadratic equation in $x = \exp(-b)$.

$$r_1 r_2 T_c x^2 + t_1 t_2 x - T_c = 0$$

Sufficient tests have been made above to ensure that none of the coefficients are exactly zero. However, it is clear that the leading quadratic term has a much smaller coefficient than the other two. Since r_1 and r_2 are typically about four percent the product is roughly 10^{-3} . The collimated transmission can be very small and this makes things even worse. A further complication is that we need to choose the only positive root.

Now the roots of $ax^2 + bx + c = 0$ can be found using the standard quadratic formula,

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

This is very bad for small values of a. Instead I use

$$q = -\frac{1}{2} \left[b + \operatorname{sgn}(b) \sqrt{b^2 - 4ac} \right]$$

with the two roots

$$x = \frac{q}{a}$$
 and $x = \frac{c}{q}$

Substituting our coefficients

$$q = -\frac{1}{2} \left[t_1 t_2 + \sqrt{t_1^2 t_2^2 + 4r_1 r_2 T_c^2} \right]$$

With some algebra, this can be shown to be

$$q = -t_1 t_2 \left[1 + \frac{r_1 r_2 T_c^2}{t_1^2 t_2^2} + \dots \right]$$

The only positive root is $x = -T_c/q$. Therefore

$$x = \frac{2T_c}{t_1 t_2 + \sqrt{t_1^2 t_2^2 + 4r_1 r_2 T_c^2}}$$

(Not very pretty, but straightforward enough.)

```
\langle Find thickness when multiple internal reflections are present 254 \rangle \equiv \{ double B; B = t1 * t2; return (-slab.cos\_angle * log(2 * Tc/(B + sqrt(B * B + 4 * Tc * Tc * r1 * r2)))); \}
```

This code is used in section 250.

108 ESTIMATING R AND T IAD (v 3-11-6) $\S255$

255. Estimating R and T.

In several places, it is useful to know an *estimate* for the values of the reflection and transmission of the sample based on the measurements. This routine provides such an estimate, but it currently ignores anything corrections that might be made for the integrating spheres.

Good values are only really obtainable when $num_measures \equiv 3$, otherwise we need to make pretty strong assumptions about the reflection and transmission values. If $num_measures < 3$, then we will assume that no collimated light makes it all the way through the sample. The specular reflection is then just that for a semi-infinite sample and Tc = 0. If $num_measures \equiv 1$, then Td is also set to zero.

```
rt
                   total reflection
                   primary or specular reflection
          rc
                   diffuse or scattered reflection
          rd
          tt
                   total transmission
                   primary or unscattered transmission
          tp
                   diffuse or scattered transmission
          td
\langle \text{ Prototype for } Estimate\_RT | 255 \rangle \equiv
  void Estimate\_RT(struct measure_type m, struct invert_type r, double *rt, double *tt, double
        *rd, double *rc, double *td, double *tc)
This code is used in sections 248 and 256.
256. \langle \text{ Definition for } Estimate\_RT | 256 \rangle \equiv
   \langle Prototype for Estimate\_RT \ 255 \rangle
     (Calculate the unscattered transmission and reflection 257)
     \langle Estimate the backscattered reflection 258\rangle
     (Estimate the scattered transmission 259)
This code is used in section 247.
```

257. If there are three measurements then the specular reflection can be calculated pretty well. If there are fewer then the unscattered transmission is assumed to be zero. This is not necessarily the case, but after all, this routine only makes estimates of the various reflection and transmission quantities.

If there are three measurements, the optical thickness of the sample is required. Of course if there are three measurements then the illumination must be collimated and we can call *What_Is_B* to find out the optical thickness. We pass this value to a routine in the fresnel.h unit and sit back and wait.

All the above is true if sphere corrections are not needed. Now, we just fob this off on another function.

 \langle Calculate the unscattered transmission and reflection 257 $\rangle \equiv Calculate_Minimum_MR(m, r, rc, tc);$

This code is used in section 256.

 $\S258$ IAD (v 3-11-6) ESTIMATING R AND T 109

258. Finding the diffuse reflection is now just a matter of checking whether V1% contains the specular reflection from the sample or not and then just adding or subtracting the specular reflection as appropriate.

This code is used in section 256.

259. The transmission values follow in much the same way as the diffuse reflection values — just subtract the specular transmission from the total transmission.

```
\langle Estimate the scattered transmission 259\rangle \equiv
  if (m.num\_measures \equiv 1) {
     *tt = 0.0;
     *td = 0.0;
  }
  else if (m.fraction_of_tc_in_mt) {
     *tt = m.m_{-}t;
     *td = *tt - *tc;
     if (*td < 0) {
        *tc = *tt;
        *td = 0;
     }
  else {
     *td = m.m_t;
     *tt = *td + *tc;
  if (Debug(DEBUG_SEARCH)) {
     fprintf(stderr, "_{""}tt_{""}tt_{"}=_{"}\%.5f\n",*tt);
     fprintf(stderr, "_{\sqcup\sqcup\sqcup\sqcup} est_{\sqcup}td_{\sqcup} = _{\sqcup}\%.5f n", *td);
This code is used in section 256.
```

260. Transforming properties. Routines to convert optical properties to calculation space and back.

IAD (v 3-11-6)

261. a2acalc is used for the albedo transformations according to

$$a_{calc} = \frac{2a - 1}{a(1 - a)}$$

Care is taken to avoid division by zero. Why was this function chosen? Well mostly because it maps the region between $[0,1] \to (-\infty, +\infty)$.

```
\langle \text{ Prototype for } a2acalc \text{ 261} \rangle \equiv
   double a2acalc (double a)
```

This code is used in sections 248 and 262.

```
262. \langle Definition for a2acalc \ 262 \rangle \equiv
   \langle \text{ Prototype for } a2acalc \text{ 261} \rangle
     if (a \le 0) return -BIG_A_VALUE;
     if (a \ge 1) return BIG_A_VALUE;
     return ((2*a-1)/a/(1-a));
```

This code is used in section 247.

263. acalc2a is used for the albedo transformations Now when we solve

$$a_c a l c = \frac{2a - 1}{a(1 - a)}$$

we obtain the quadratic equation

This code is used in section 247.

$$a_{calc}a^2 + (2 - a_{calc})a - 1 = 0$$

The only root of this equation between zero and one is

$$a = \frac{-2 + a_{calc} + \sqrt{a_{calc}^2 + 4}}{2a_{calc}}$$

I suppose that I should spend the time to recast this using the more appropriate numerical solutions of the quadratic equation, but this worked and I will leave it as it is for now.

```
\langle \text{ Prototype for } acalc2a \text{ 263} \rangle \equiv
   double acalc2a(double acalc)
This code is used in sections 248 and 264.
264. \langle \text{ Definition for } acalc2a \text{ 264} \rangle \equiv
   \langle \text{ Prototype for } acalc2a \text{ 263} \rangle
     if (acalc \equiv BIG_A_VALUE) return 1.0;
     else if (acalc \equiv -BIG_A_VALUE) return 0.0;
     else if (fabs(acalc) < SMALL_A_VALUE) return 0.5;
     else return ((-2 + acalc + sqrt(acalc * acalc + 4))/(2 * acalc));
```

265. *q2qcalc* is used for the anisotropy transformations according to

$$g_{calc} = \frac{g}{1 + |g|}$$

```
which maps (-1,1) \rightarrow (-\infty, +\infty).

\langle \text{Prototype for } g2gcalc | 265 \rangle \equiv \text{double } g2gcalc | (\text{double } g)

This code is used in sections 248 and 266.

266. \langle \text{Definition for } g2gcalc | 266 \rangle \equiv \langle \text{Prototype for } g2gcalc | 265 \rangle = \{ \text{if } (g \leq -1) \text{ return } (-\text{HUGE\_VAL}); \text{ if } (g \geq 1) \text{ return } (\text{HUGE\_VAL}); \text{ return } (g/(1 - fabs(g))); \}

This code is used in section 247.
```

267. gcalc2g is used for the anisotropy transformations it is the inverse of g2gcalc. The relation is

$$g = \frac{g_{calc}}{1 + |g_{calc}|}$$

```
double gcalc2g(double gcalc)
This code is used in sections 248 and 268.

268. ⟨Definition for gcalc2g 268⟩ ≡
⟨Prototype for gcalc2g 267⟩
{
    if (gcalc ≡ -HUGE_VAL) return -1.0;
    if (gcalc ≡ HUGE_VAL) return 1.0;
    return (gcalc/(1 + fabs(gcalc)));
}
```

 $\langle \text{ Prototype for } gcalc2q \text{ 267} \rangle \equiv$

269. b2bcalc is used for the optical depth transformations it is the inverse of bcalc2b. The relation is

$$b_{calc} = \ln(b)$$

The only caveats are to ensure that I don't take the logarithm of something big or non-positive.

```
\langle \text{ Prototype for } b2bcalc \text{ 269} \rangle \equiv  double b2bcalc \text{ (double } b)
```

This code is used in section 247.

This code is used in sections 248 and 270.

```
270.
          \langle \text{ Definition for } b2bcalc | 270 \rangle \equiv
   \langle Prototype for b2bcalc 269 \rangle
      if (b \equiv \text{HUGE\_VAL}) return HUGE_VAL;
     if (b \le 0) return 0.0;
      return (log(b));
This code is used in section 247.
```

bcalc2b is used for the anisotropy transformations it is the inverse of b2bcalc. The relation is

$$b = \exp(b_{calc})$$

The only tricky part is to ensure that I don't exponentiate something big and get an overflow error. In ANSI C the maximum value for x such that 10^x is in the range of representable finite floating point numbers (for doubles) is given by DBL_MAX_10_EXP. Thus if we want to know if

$$e^{b_{calc}} > 10^x$$

or

112

$$b_{calc} > x \ln(10) \approx 2.3x$$

and this is the criterion that I use.

```
\langle \text{ Prototype for } bcalc2b \text{ 271} \rangle \equiv
   double bcalc2b(double bcalc)
```

This code is used in sections 248 and 272.

```
272. \langle \text{ Definition for } bcalc2b | 272 \rangle \equiv
   \langle \text{ Prototype for } bcalc2b \text{ 271} \rangle
      if (bcalc \equiv HUGE_VAL) return HUGE_VAL;
     if (bcalc > 2.3 * DBL_MAX_10_EXP) return HUGE_VAL;
      return (exp(bcalc));
```

This code is used in section 247.

273. twoprime converts the true albedo a, optical depth b to the reduced albedo ap and reduced optical depth bp that correspond to g = 0.

```
\langle \text{ Prototype for } twoprime \ 273 \rangle \equiv
```

```
void twoprime(\mathbf{double}\ a, \mathbf{double}\ b, \mathbf{double}\ g, \mathbf{double}\ *ap, \mathbf{double}\ *bp)
```

This code is used in sections 248 and 274.

```
274. \langle Definition for two prime 274 \rangle \equiv
   \langle \text{ Prototype for } twoprime 273 \rangle
      if (a \equiv 1 \land g \equiv 1) *ap = 0.0;
      else *ap = (1 - g) * a/(1 - a * g);
      if (b \equiv \text{HUGE\_VAL}) *bp = \text{HUGE\_VAL};
      else *bp = (1 - a * g) * b;
```

This code is used in section 247.

275. two unprime converts the reduced albedo ap and reduced optical depth bp (for g=0) to the true albedo a and optical depth b for an anisotropy g.

277. abgg2ab assume a, b, g, and g1 are given this does the similarity translation that you would expect it should by converting it to the reduced optical properties and then transforming back using the new value of g

```
⟨Prototype for abgg2ab 277⟩ ≡
    void abgg2ab (double a1, double b1, double g1, double g2, double *a2, double *b2)
This code is used in sections 248 and 278.

278. ⟨Definition for abgg2ab 278⟩ ≡
    ⟨Prototype for abgg2ab 277⟩
{
    double a, b;
    twoprime(a1, b1, g1, &a, &b);
    twounprime(a, b, g2, a2, b2);
}
```

This code is used in section 247.

This code is used in section 247.

279. abgb2ag translates reduced optical properties to unreduced values assuming that the new optical thickness is given i.e., a1 and b1 are a' and b' for g=0. This routine then finds the appropriate anisotropy and albedo which correspond to an optical thickness b2.

If both b1 and b2 are zero then just assume g=0 for the unreduced values.

```
\langle \text{Prototype for } abgb2ag \ 279 \rangle \equiv  void abgb2ag (\text{double } a1, \text{double } b1, \text{double } b2, \text{double } *a2, \text{double } *g2) This code is used in sections 248 and 280.
```

IAD (v 3-11-6)

```
280.
         \langle \text{ Definition for } abqb2aq 280 \rangle \equiv
   \langle \text{ Prototype for } abgb2ag 279 \rangle
     if (b1 \equiv 0 \lor b2 \equiv 0) {
        *a2 = a1;
        *g2 = 0;
     if (b2 < b1) b2 = b1;
     if (a1 \equiv 0) *a2 = 0.0;
     else {
        if (a1 \equiv 1) *a2 = 1.0;
        else {
           if (b1 \equiv 0 \lor b2 \equiv \text{HUGE\_VAL}) *a2 = a1;
           else *a2 = 1 + b1/b2 * (a1 - 1);
     if (*a2 \equiv 0 \lor b2 \equiv 0 \lor b2 \equiv \text{HUGE\_VAL}) *g2 = 0.5;
     else *g2 = (1 - b1/b2)/(*a2);
This code is used in section 247.
281. Guessing an inverse.
   This routine is not used anymore.
\langle \text{ Prototype for } slow\_guess | 281 \rangle \equiv
   void slow\_quess(struct measure_type m, struct invert_type *r, double *a, double *b, double *g)
This code is used in section 282.
        \langle \text{ Definition for } slow\_guess | 282 \rangle \equiv
   ⟨ Prototype for slow_guess 281 ⟩

 $\S307$ IAD (v 3-11-6) INDEX 121

307. Index. Here is a cross-reference table for the inverse adding-doubling program. All sections in which an identifier is used are listed with that identifier, except that reserved words are indexed only when they appear in format definitions, and the appearances of identifiers in section names are not indexed. Underlined entries correspond to where the identifier was declared. Error messages and a few other things like "ASCII code dependencies" are indexed here too.

(Initialize the nodes of the b and q simplex 234) Used in section 232.
\langle Iteratively solve for b 225\rangle Used in section 224.
(Local Variables for Calculation 12) Used in section 11.
Nonworking code 151
One parameter deviation 176 Used in section 175.
 One parameter search 55 \ Used in section 54.
 Print diagnostics 178 \rangle Used in section 170.
(Print results function 25) Used in section 2.
\langle \text{Prototype for } Allocate\_Grid \ 132 \rangle Used in sections 112 and 133.
(Prototype for Calculate_Distance_With_Corrections 169) Used in sections 112 and 170.
(Prototype for Calculate_Distance 165) Used in sections 112 and 166.
(Prototype for Calculate_Grid_Distance 167) Used in sections 112 and 168.
\langle \text{ Prototype for } Calculate\_MR\_MT \ 74 \rangle Used in sections 39 and 75.
\langle \text{Prototype for } Calculate\_Minimum\_MR \ 76 \rangle Used in sections 39 and 77.
\langle Prototype for Debug 301 \rangle Used in sections 248 and 302.
\langle \text{Prototype for } \textit{Estimate\_RT} \; 255 \rangle Used in sections 248 and 256.
\langle \text{ Prototype for } Fill\_AB\_Grid \ 149 \rangle \text{ Used in sections 111 and 150.}
\langle \text{Prototype for } Fill\_AG\_Grid \ 154 \rangle Used in sections 111 and 155.
\langle \text{Prototype for } Fill\_BG\_Grid \ 157 \rangle Used in sections 112 and 158.
\langle \text{Prototype for } Fill\_BaG\_Grid \ 159 \rangle \text{ Used in sections } 112 \text{ and } 160.
```

```
\langle \text{ Prototype for } Fill\_BsG\_Grid \ 161 \rangle \text{ Used in sections } 112 \text{ and } 162.
\langle \text{Prototype for } Fill\_Grid \ 163 \rangle \text{ Used in sections } 112 \text{ and } 164.
\langle \text{ Prototype for } Find\_AB\_fn \text{ 181} \rangle
                                               Used in sections 112 and 182.
\langle \text{Prototype for } Find\_AG\_fn \mid 179 \rangle Used in sections 112 and 180.
\langle \text{ Prototype for } Find\_A\_fn \text{ 187} \rangle Used in sections 112 and 188.
\langle \text{Prototype for } Find\_BG\_fn \ 193 \rangle \text{ Used in sections } 112 \text{ and } 194.
\langle \text{Prototype for } Find\_B\_fn \mid 189 \rangle Used in sections 112 and 190.
(Prototype for Find_BaG_fn 195) Used in sections 112 and 196.
\langle \text{Prototype for } Find\_Ba\_fn \mid 183 \rangle Used in sections 112 and 184.
\langle \text{Prototype for } Find\_BsG\_fn \ 197 \rangle Used in sections 112 and 198.
\langle Prototype for Find\_Bs\_fn\ 185\rangle Used in sections 112 and 186.
\langle \text{Prototype for } Find\_G\_fn \ 191 \rangle Used in sections 112 and 192.
\langle \text{ Prototype for } Gain\_11 \text{ 117} \rangle Used in sections 112 and 118.
\langle \text{Prototype for } Gain\_22 \text{ 119} \rangle Used in sections 112 and 120.
\langle \text{ Prototype for } Gain \ 115 \rangle \quad \text{Used in sections } 112 \text{ and } 116.
\langle \text{Prototype for } Get\_Calc\_State | 128 \rangle \text{ Used in sections } 112 \text{ and } 129.
\langle \text{ Prototype for } Grid\_ABG \text{ 134} \rangle Used in sections 112 and 135.
 Prototype for Initialize_Measure 65 \ Used in sections 39 and 66.
(Prototype for Initialize_Result 57) Used in sections 39 and 58.
\langle \text{ Prototype for } Inverse\_RT \mid 41 \rangle Used in sections 39 and 42.
(Prototype for Max_Light_Loss 201) Used in sections 112 and 202.
(Prototype for MinMax\_MR\_MT 78) Used in sections 39 and 79.
(Prototype for Near_Grid_Points 144) Used in sections 112 and 145.
(Prototype for Print_Invert_Type 303) Used in sections 248 and 304.
(Prototype for Print_Measure_Type 305) Used in sections 248 and 306.
\langle \text{ Prototype for } RT\_Flip \ 146 \rangle \quad \text{Used in section } 147.
(Prototype for Read_Data_Line 95) Used in sections 89 and 96.
\langle Prototype for Read\_Header 91 \rangle Used in sections 89 and 92.
(Prototype for Same_Calc_State 130) Used in sections 112 and 131.
(Prototype for Set_Calc_State 126) Used in sections 112 and 127.
(Prototype for Set_Debugging 299) Used in sections 248 and 300.
\langle Prototype for Spheres_Inverse_RT2 80 \rangle Used in sections 39, 40, and 81.
\langle Prototype for Spheres_Inverse_RT | 67 \rangle Used in sections 40 and 68.
\langle \text{Prototype for } Two\_Sphere\_R \mid 121 \rangle Used in sections 112 and 122.
\langle Prototype for Two\_Sphere\_T 123 \rangle
                                                   Used in sections 112 and 124.
\langle \text{Prototype for } U\_Find\_AB \text{ 206} \rangle Used in sections 205 and 207.
\langle \text{Prototype for } U_F ind_A G | 226 \rangle Used in sections 205 and 227.
\langle \text{Prototype for } U\_Find\_A \text{ 219} \rangle Used in sections 205 and 220.
\langle \text{Prototype for } U\_Find\_BG \text{ 231} \rangle Used in sections 205 and 232.
\langle \text{Prototype for } U\_Find\_BaG \text{ 237} \rangle Used in sections 205 and 238.
\langle \text{Prototype for } U\_Find\_Ba \text{ 217} \rangle Used in sections 205 and 218.
\langle \text{Prototype for } U\_Find\_BsG \text{ 242} \rangle Used in sections 205 and 243.
\langle \text{ Prototype for } U\_Find\_Bs \text{ 215} \rangle
                                              Used in sections 205 and 216.
\langle \text{ Prototype for } U\_Find\_B \text{ 223} \rangle
                                            Used in sections 205 and 224.
\langle \text{Prototype for } U_F ind_G 221 \rangle Used in sections 205 and 222.
⟨ Prototype for Valid_Grid 136 ⟩
                                             Used in sections 112 and 137.
\langle \text{ Prototype for } What\_Is\_B \text{ 249} \rangle Used in sections 248 and 250.
(Prototype for Write_Header 103) Used in sections 89 and 104.
\langle Prototype for a2acalc 261 \rangle Used in sections 248 and 262.
\langle \text{ Prototype for } abg\_distance \ 142 \rangle \quad \text{Used in sections } 112 \text{ and } 143.
\langle \text{Prototype for } abqb2aq 279 \rangle Used in sections 248 and 280.
\langle \text{Prototype for } abqq2ab \ 277 \rangle Used in sections 248 and 278.
```

```
\langle \text{ Prototype for } acalc2a \text{ 263} \rangle Used in sections 248 and 264.
\langle \text{ Prototype for } b2bcalc \text{ 269} \rangle Used in sections 248 and 270.
\langle \text{ Prototype for } bcalc2b \text{ 271} \rangle Used in sections 248 and 272.
\langle \text{Prototype for } check\_magic \ 101 \rangle Used in section 102.
(Prototype for determine_search 53) Used in sections 39 and 54.
\langle Prototype \text{ for } ez\_Inverse\_RT \text{ 63} \rangle Used in sections 39, 40, and 64.
\langle \text{ Prototype for } q2qcalc \ 265 \rangle Used in sections 248 and 266.
(Prototype for qcalc2q 267) Used in sections 248 and 268.
\langle \text{ Prototype for } maxloss | 199 \rangle Used in sections 112 and 200.
\langle \text{Prototype for } measure\_OK \mid 46 \rangle Used in sections 39 and 47.
(Prototype for quick_quess 286) Used in sections 248 and 287.
\langle \text{ Prototype for } read\_number 99 \rangle Used in section 100.
\langle \text{ Prototype for } skip\_white 97 \rangle Used in section 98.
\langle \text{ Prototype for } slow\_quess 281 \rangle Used in section 282.
(Prototype for twoprime 273) Used in sections 248 and 274.
\langle Prototype for two unprime 275 \rangle Used in sections 248 and 276.
(Put final values in result 213) Used in sections 207, 216, 218, 220, 222, 224, 227, 232, 238, and 243.
 Read coefficients for reflection sphere 93 \ Used in section 92.
(Read coefficients for transmission sphere 94) Used in section 92.
\langle Slow guess for a alone 283\rangle Used in section 282.
(Slow guess for a and b or a and g 285) Used in section 282.
(Slow guess for b alone 284) Used in section 282.
(Solve if multiple internal reflections are not present 253) Used in section 250.
(Structs to export from IAD Types 35, 36, 37) Used in section 32.
 Testing MC code 16
Tests for invalid grid 138, 139, 140, 141 \ Used in section 137.
 Two parameter deviation 177 \ Used in section 175.
 Two parameter search 56 \ Used in section 54.
 Unused diffusion fragment 203
Write Header 14 Used in section 11.
Write first sphere info 108 Used in section 104.
 Write general sphere info 107 Used in section 104.
\langle Write irradiation info 106 \rangle Used in section 104.
Write measure and inversion info 110 Used in section 104.
 Write second sphere info 109 \> Used in section 104.
Write slab info 105 Used in section 104.
\langle \text{ Zero GG } 156 \rangle Used in sections 150, 155, 158, 160, and 162.
\langle calculate coefficients function 22, 23\rangle Used in section 2.
(handle analysis 70) Used in section 68.
\langle \text{ handle measurement 71} \rangle Used in section 68.
\langle handle reflection sphere 72 \rangle Used in section 68.
\langle \text{ handle setup } 69 \rangle Used in section 68.
(handle transmission sphere 73) Used in section 68.
(handle2 analysis 86) Used in section 81.
(handle2 illumination 83) Used in section 81.
(handle2 measurement 87) Used in section 81.
(handle2 reflection sphere 84) Used in section 81.
\langle \text{ handle 2 sample 82} \rangle Used in section 81.
(handle2 transmission sphere 85) Used in section 81.
\langle iad_calc.c 111 \rangle
(iad_calc.h 112)
\langle iad_find.c \frac{204}{} \rangle
```

```
\langle iad\_find.h 205 \rangle
